Steem is a blockchain-based rewards platform for publishers to monetize content and grow community.

It is based on *Graphene* (tm), a blockchain technology stack (i.e. software) that allows for fast transactions and ascalable blockchain solution. In case of Steem, it comes with decentralized publishing of content.

The Steem library has been designed to allow developers to easily access its routines and make use of the network without dealing with all the related blockchain technology and cryptography. This library can be used to do anything that is allowed according to the Steem blockchain protocol.

CHAPTER 1

About this Library

The purpose of *beem* is to simplify development of products and services that use the Steem blockchain. It comes with

- it's own (bip32-encrypted) wallet
- RPC interface for the Blockchain backend
- JSON-based blockchain objects (accounts, blocks, prices, markets, etc)
- a simple to use yet powerful API
- transaction construction and signing
- push notification API
- *and more*

CHAPTER 2

Quickstart

Note:

All methods that construct and sign a transaction can be given the `account=` parameter to identify the user that is going to be affected by this transaction, e.g.:

- the source account in a transfer
- the account that buys/sells an asset in the exchange
- the account whose collateral will be modified

Important, If no account is given, then the `default_account` according to the settings in config is used instead.

```
from beem import Steem
steem = Steem()
steem.wallet.unlock("wallet-passphrase")
account = Account("test", steem_instance=steem)
account.transfer("<to>", "<amount>", "<asset>", "<memo>")
```

```
from beem.blockchain import Blockchain
blockchain = Blockchain()
for op in Blockchain.ops():
    print(op)
```

```
from beem.block import Block
print(Block(1))
```

```
from beem.account import Account
account = Account("test")
print(account.balances)
for h in account.history():
    print(h)
```

```
from beem.steem import Steem
stm = Steem()
stm.wallet.purge()
stm.wallet.create("wallet-passphrase")
stm.wallet.unlock("wallet-passphrase")
stm.wallet.addPrivateKey("512345678")
stm.wallet.lock()
```

```
from beem.market import Market
market = Market()
print(market.ticker())
market.steem.wallet.unlock("wallet-passphrase")
print(market.sell(300, 100) # sell 100 STEEM for 300 STEEM/SBD
```

CHAPTER 3

General

3.1 Installation

Warning: install beem will install pycryptodome which is not compatible to pycrypto which is need for python-steem.
At the moment, either beem or steem can be install at one maschine!

For Debian and Ubuntu, please ensure that the following packages are installed:

```
sudo apt-get install build-essential libssl-dev python-dev
```

For Fedora and RHEL-derivatives, please ensure that the following packages are installed:

```
sudo yum install gcc openssl-devel python-devel
```

For OSX, please do the following:

```
brew install openssl
export CFLAGS="-I$(brew --prefix openssl)/include $CFLAGS"
export LDFLAGS="-L$(brew --prefix openssl)/lib $LDFLAGS"
```

For Termux on Android, please install the following packages:

```
pkg install clang openssl-dev python-dev
```

Install beem by pip:

```
pip install -U beem
```

You can install beem from this repository if you want the latest but possibly non-compiling version:

```
git clone https://github.com/holgern/beem.git
cd beem
python setup.py build

python setup.py install --user
```

Run tests after install:

```
pytest
```

3.1.1 Manual installation:

```
$ git clone https://github.com/holgern/beem/
$ cd beem
$ python setup.py build
$ python setup.py install --user
```

3.1.2 Upgrade

```
$ pip install --user --upgrade
```

3.2 Quickstart

3.3 Tutorials

3.3.1 Bundle Many Operations

With Steem, you can bundle multiple operations into a single transactions. This can be used to do a multi-send (one sender, multiple receivers), but it also allows to use any other kind of operation. The advantage here is that the user can be sure that the operations are executed in the same order as they are added to the transaction.

```
from pprint import pprint
from beem import Steem
from beem.account import Account

testnet = Steem(
    nobroadcast=True,
    bundle=True,
)

account = Account("test", steem_instance=testnet)
account.steem.wallet.unlock("supersecret")

account.transfer("test1", 1, "STEEM", account="test")
account.transfer("test1", 1, "STEEM", account="test")
account.transfer("test1", 1, "STEEM", account="test")
account.transfer("test1", 1, "STEEM", account="test")

pprint(testnet.broadcast())
```

3.3.2 Simple Sell Script

```

from beem import Steem
from beem.market import Market
from beem.price import Price
from beem.amount import Amount

#
# Instantiate Steem (pick network via API node)
#
steem = Steem(
    nobroadcast=True    # <<---- set this to False when you want to fire!
)

#
# Unlock the Wallet
#
steem.wallet.unlock("<supersecret>")

#
# This defines the market we are looking at.
# The first asset in the first argument is the *quote*
# Sell and buy calls always refer to the *quote*
#
market = Market(
    steem_instance=steem
)

#
# Sell an asset for a price with amount (quote)
#
print(market.sell(
    Price(100.0, "STEEM/SBD"),
    Amount("0.01 STEEM")
))

```

3.3.3 Sell at a timely rate

```

import threading
from beem import Steem
from beem.market import Market
from beem.price import Price
from beem.amount import Amount

def sell():
    """ Sell an asset for a price with amount (quote)
    """
    print(market.sell(
        Price(100.0, "USD/GOLD"),
        Amount("0.01 GOLD")
    ))

    threading.Timer(60, sell).start()

if __name__ == "__main__":

```

(continues on next page)

(continued from previous page)

```
#  
# Instantiate Steem (pick network via API node)  
#  
steem = Steem(  
    nobroadcast=True    # <<---- set this to False when you want to fire!  
)  
  
#  
# Unlock the Wallet  
#  
steem.wallet.unlock("<supersecret>")  
  
#  
# This defines the market we are looking at.  
# The first asset in the first argument is the *quote*  
# Sell and buy calls always refer to the *quote*  
#  
market = Market(  
    steem_instance=steem  
)  
  
sell()
```

3.4 Configuration

The pysteem library comes with its own local configuration database that stores information like

- API node URL
- default account name
- the encrypted master password

and potentially more.

You can access those variables like a regular dictionary by using

```
from beem import Steem  
steem = Steem()  
print(steem.config.items())
```

Keys can be added and changed like they are for regular dictionaries.

If you don't want to load the `steem.Steem` class, you can load the configuration directly by using:

```
from beem.storage import configStorage as config
```

3.4.1 API

```
class beem.storage.Configuration
```

This is the configuration storage that stores key/value pairs in the `config` table of the SQLite3 database.

```
checkBackup()  
Backup the SQL database every 7 days
```

```
create_table()
    Create the new table in the SQLite database

delete(key)
    Delete a key from the configuration store

exists_table()
    Check if the database table exists

get(key, default=None)
    Return the key if exists or a default value

nodes = ['wss://steemd.pevo.science', 'wss://gtg.steem.house:8090', 'wss://rpc.steemli...
    Default configuration
```

3.5 Contributing to python-steem

We welcome your contributions to our project.

3.5.1 Repository

The *main* repository of python-steem is currently located at:

<https://github.com/holgern/beem>

3.5.2 Flow

This project makes heavy use of `git flow`. If you are not familiar with it, then the most important thing for your to understand is that:

pull requests need to be made against the develop branch

3.5.3 How to Contribute

0. Familiarize yourself with *contributing on github* <<https://guides.github.com/activities/contributing-to-open-source/>>
1. Fork or branch from the master.
2. Create commits following the commit style
3. Start a pull request to the master branch
4. Wait for a @holger80 or another member to review

3.5.4 Issues

Feel free to submit issues and enhancement requests.

3.5.5 Contributing

Please refer to each project’s style guidelines and guidelines for submitting patches and additions. In general, we follow the “fork-and-pull” Git workflow.

1. **Fork** the repo on GitHub
2. **Clone** the project to your own machine
3. **Commit** changes to your own branch
4. **Push** your work back up to your fork
5. Submit a **Pull request** so that we can review your changes

NOTE: Be sure to merge the latest from “upstream” before making a pull request!

3.5.6 Copyright and Licensing

This library is open sources under the MIT license. We require your to release your code under that license as well.

3.6 Support and Questions

We have currently not setup a distinct channel for development around pysteemi. However, many of the contributors are frequently reading through these channels:

CHAPTER 4

Packages

4.1 beem

4.1.1 beem package

Submodules

beem.account module

```
class beem.account.Account(account, id_item='name', full=True, lazy=False,  
                           steem_instance=None)  
Bases: beem.blockchainobject.BlockchainObject
```

This class allows to easily access Account data

Parameters

- **account_name** (*str*) – Name of the account
- **steem_instance** (*steem.steem.Steem*) – Steem instance
- **lazy** (*bool*) – Use lazy loading
- **full** (*bool*) – Obtain all account data including orders, positions, etc.

Returns

Account data

Return type

dictionary
Raises *beem.exceptions.AccountDoesNotExistException* – if account does not exist

Instances of this class are dictionaries that come with additional methods (see below) that allow dealing with an account and its corresponding functions.

```
from beem.account import Account
account = Account("test")
print(account)
print(account.balances)
```

Note: This class comes with its own caching function to reduce the load on the API server. Instances of this class can be refreshed with `Account.refresh()`.

approvewitness (witness, account=None, approve=True, **kwargs)

Approve a witness

Parameters

- **witnesses** (*list*) – list of Witness name or id
- **account** (*str*) – (optional) the account to allow access to (defaults to `default_account`)

available_balances

List balances of an account. This call returns instances of `steem.amount.Amount`.

balance (balances, symbol)

Obtain the balance of a specific Asset. This call returns instances of `steem.amount.Amount`.

balances**cancel_transfer_from_savings (request_id, account=None)**

Cancel a withdrawal from ‘savings’ account. :param str `request_id`: Identifier for tracking or cancelling the withdrawal :param str `account`: (optional) the source account for the transfer if not `default_account`

claim_reward_balance (reward_steam='0 STEEM', reward_sbd='0 SBD', reward_vests='0 VESTS', account=None)

Claim reward balances. By default, this will claim all outstanding balances. To bypass this behaviour, set desired claim amount by setting any of `reward_steam`, `reward_sbd` or `reward_vests`. Args:

`reward_steam` (string): Amount of STEEM you would like to claim. `reward_sbd` (string): Amount of SBD you would like to claim. `reward_vests` (string): Amount of VESTS you would like to claim. `account` (string): The source account for the claim if not `default_account` is used.

convert (amount, account=None, request_id=None)

Convert SteemDollars to Steem (takes one week to settle) :param float `amount`: number of VESTS to withdraw :param str `account`: (optional) the source account for the transfer if not `default_account` :param str `request_id`: (optional) identifier for tracking the conversion‘

delegate_vesting_shares (to_account, vesting_shares, account=None)

Delegate SP to another account. Args:

`to_account` (string): Account we are delegating shares to (delegatee). `vesting_shares` (string): Amount of VESTS to delegate eg. *10000 VESTS*. `account` (string): The source account (delegator). If not specified, `default_account` is used.

disapprovewitness (witness, account=None, **kwargs)

Disapprove a witness

Parameters

- **witnesses** (*list*) – list of Witness name or id

- **account** (str) – (optional) the account to allow access to (defaults to default_account)

ensure_full()

follow (follow, what=['blog'], account=None)
Follow another account's blog :param str follow: Follow this account :param list what: List of states to follow
(defaults to ['blog'])

Parameters **account** (str) – (optional) the account to allow access to (defaults to default_account)

getSimilarAccountNames (limit=5)
Returns limit similar accounts with name as array

get_bandwidth (bandwidth_type=1, account=None, raw_data=False)
get_account_bandwidth

get_follow_count (account=None)

get_followers()

get_following()

get_owner_history (account=None)

get_recharge_hours (voting_power_goal=100, precision=2)

get_recharge_remainder_minutes (voting_power_goal=100, precision=0)

get_recharge_time_str (voting_power_goal=100)

get_recovery_request (account=None)

get_voting_value_SBD (voting_weight=100, voting_power=None, steem_power=None, precision=2)

history (limit=100, only_ops=[], exclude_ops=[])
Returns a generator for individual account transactions. The latest operation will be first. This call can be used in a for loop.

Parameters

- **limit** (int/datetime) – limit number of transactions to return (*optional*)
- **only_ops** (array) – Limit generator by these operations (*optional*)
- **exclude_ops** (array) – Exclude these operations from generator (*optional*)

interest()
Caluculate interest for an account :param str account: Account name to get interest for

is_fully_loaded
Is this instance fully loaded / e.g. all data available?

name

print_info (force_refresh=False, return_str=False)
Prints import information about the account

profile
Returns the account profile

refresh()
Refresh/Obtain an account's data from the API server

rep

reputation(precision=2)

reward_balances

saving_balances

steem_power(onlyOwnSP=False)

total_balances

transfer(to, amount, asset, memo='', account=None, **kwargs)

Transfer an asset to another account.

Parameters

- **to** (str) – Recipient
- **amount** (float) – Amount to transfer
- **asset** (str) – Asset to transfer
- **memo** (str) – (optional) Memo, may begin with # for encrypted messaging
- **account** (str) – (optional) the source account for the transfer if not default_account

transfer_from_savings(amount, asset, memo, request_id=None, to=None, account=None)

Withdraw SBD or STEEM from ‘savings’ account. :param float amount: STEEM or SBD amount :param float asset: ‘STEEM’ or ‘SBD’ :param str memo: (optional) Memo :param str request_id: (optional) identifier for tracking or cancelling the withdrawal :param str to: (optional) the source account for the transfer if not default_account :param str account: (optional) the source account for the transfer if not default_account

transfer_to_savings(amount, asset, memo, to=None, account=None)

Transfer SBD or STEEM into a ‘savings’ account. :param float amount: STEEM or SBD amount :param float asset: ‘STEEM’ or ‘SBD’ :param str memo: (optional) Memo :param str to: (optional) the source account for the transfer if not default_account :param str account: (optional) the source account for the transfer if not default_account

transfer_to_vesting(amount, to=None, account=None, **kwargs)

Vest STEEM

Parameters

- **amount** (float) – Amount to transfer
- **to** (str) – Recipient (optional) if not set equal to account
- **account** (str) – (optional) the source account for the transfer if not default_account

type_id = 2

unfollow(unfollow, what=['blog'], account=None)

Unfollow another account’s blog :param str unfollow: Follow this account :param list what: List of states to follow

(defaults to ['blog'])

Parameters `account` (`str`) – (optional) the account to allow access to (defaults to `default_account`)

update_account_profile (`profile, account=None`)

Update an account's meta data (`json_meta`) :param dict json: The meta data to use (i.e. use `Profile()` from `account.py`)

Parameters `account` (`str`) – (optional) the account to allow access to (defaults to `default_account`)

update_memo_key (`key, account=None, **kwargs`)

Update an account's memo public key

This method does **not** add any private keys to your wallet but merely changes the memo public key.

Parameters

- `key` (`str`) – New memo public key
- `account` (`str`) – (optional) the account to allow access to (defaults to `default_account`)

verify_account_authority (`keys, account=None`)

voting_power (`precision=2, with_regeneration=True`)

withdraw_vesting (`amount, account=None`)

Withdraw VESTS from the vesting account. :param float amount: number of VESTS to withdraw over a period of 104 weeks :param str account: (optional) the source account for the transfer if not `default_account`

beem.aes module

class `beem.aes.AESCipher` (`key`)

Bases: `object`

A classical AES Cipher. Can use any size of data and any size of password thanks to padding. Also ensure the coherence and the type of the data with a unicode to byte converter.

`decrypt` (`enc`)

`encrypt` (`raw`)

`static str_to_bytes` (`data`)

beem.amount module

class `beem.amount.Amount` (*`args, amount=None, asset=None, steem_instance=None`)

Bases: `dict`

This class deals with Amounts of any asset to simplify dealing with the tuple:

(`amount, asset`)

Parameters

- `args` (`list`) – Allows to deal with different representations of an amount

- **amount** (*float*) – Let's create an instance with a specific amount
- **asset** (*str*) – Let's you create an instance with a specific asset (symbol)
- **steem_instance** (*steem.steem.Steem*) – Steem instance

Returns All data required to represent an Amount/Asset

Return type dict

Raises ValueError – if the data provided is not recognized

Way to obtain a proper instance:

- args can be a string, e.g.: “1 SBD”
- args can be a dictionary containing amount and asset_id
- args can be a dictionary containing amount and asset
- args can be a list of a float and str (symbol)
- args can be a list of a float and a *beem.asset.Asset*
- amount and asset are defined manually

An instance is a dictionary and comes with the following keys:

- amount (float)
- symbol (str)
- asset (instance of *beem.asset.Asset*)

Instances of this class can be used in regular mathematical expressions (+-*/%) such as:

```
from beem.amount import Amount
from beem.asset import Asset
a = Amount("1 STEEM")
b = Amount(1, "STEEM")
c = Amount("20", Asset("STEEM"))
a + b
a * 2
a += b
a /= 2.0
```

amount

Returns the amount as float

asset

Returns the asset as instance of *steem.asset.Asset*

copy()

Copy the instance and make sure not to use a reference

json()

symbol

Returns the symbol of the asset

tuple()

beem.asset module

```
class beem.asset.Asset(asset, lazy=False, full=False, steem_instance=None)
Bases: beem.blockchainobject.BlockchainObject
```

Deals with Assets of the network.

Parameters

- **Asset** (*str*) – Symbol name or object id of an asset
- **lazy** (*bool*) – Lazy loading
- **full** (*bool*) – Also obtain bitasset-data and dynamic asset dat
- **steem_instance** ([beem.steem.Steem](#)) – Steem instance

Returns All data of an asset

Return type dict

Note: This class comes with its own caching function to reduce the load on the API server. Instances of this class can be refreshed with `Asset.refresh()`.

precision

refresh()

Refresh the data from the API server

symbol

type_id = 3

beem.steem module

```
class beem.steem.Steem(node='', rpcuser='', rpcpassword='', debug=False,
data_refresh_time_seconds=900, **kwargs)
```

Bases: object

Connect to the Steem network.

Parameters

- **node** (*str*) – Node to connect to (*optional*)
- **rpcuser** (*str*) – RPC user (*optional*)
- **rpcpassword** (*str*) – RPC password (*optional*)
- **nobroadcast** (*bool*) – Do **not** broadcast a transaction! (*optional*)
- **debug** (*bool*) – Enable Debugging (*optional*)
- **keys** (*array, dict, string*) – Predefine the wif keys to shortcut the wallet database (*optional*)
- **offline** (*bool*) – Boolean to prevent connecting to network (defaults to False) (*optional*)
- **proposer** (*str*) – Propose a transaction using this proposer (*optional*)
- **proposal_expiration** (*int*) – Expiration time (in seconds) for the proposal (*optional*)

- **proposal_review** (*int*) – Review period (in seconds) for the proposal (*optional*)
- **expiration** (*int*) – Delay in seconds until transactions are supposed to expire (*optional*)
- **blocking** (*str*) – Wait for broadcasted transactions to be included in a block and return full transaction (can be “head” or “irrversible”)
- **bundle** (*bool*) – Do not broadcast transactions right away, but allow to bundle operations (*optional*)

Three wallet operation modes are possible:

- **Wallet Database:** Here, the steemlibs load the keys from the locally stored wallet SQLite database (see `storage.py`). To use this mode, simply call `Steem()` without the `keys` parameter
- **Providing Keys:** Here, you can provide the keys for your accounts manually. All you need to do is add the wif keys for the accounts you want to use as a simple array using the `keys` parameter to `Steem()`.
- **Force keys:** This more is for advanced users and requires that you know what you are doing. Here, the `keys` parameter is a dictionary that overwrite the `active`, `owner`, or `memo` keys for any account. This mode is only used for *foreign* signatures!

If no node is provided, it will connect to the node of <http://uptick.rocks>. It is **highly** recommended that you pick your own node instead. Default settings can be changed with:

```
uptick set node <host>
```

where `<host>` starts with `ws://` or `wss://`.

The purpose of this class it to simplify interaction with Steem.

The idea is to have a class that allows to do this:

```
from beem import Steem
steem = Steem()
print(steem.info())
```

All that is requires is for the user to have added a key with `uptick`

```
uptick addkey
```

and setting a default author:

```
uptick set default_account xeroc
```

This class also deals with edits, votes and reading content.

allow (*foreign*, `weight=None`, `permission='posting'`, `account=None`, `threshold=None`, `**kwargs`)

Give additional access to an account by some other public key or account.

Parameters

- **foreign** (*str*) – The foreign account that will obtain access
- **weight** (*int*) – (optional) The weight to use. If not define, the threshold will be used. If the weight is smaller than the threshold, additional signatures will be required. (defaults to threshold)
- **permission** (*str*) – (optional) The actual permission to modify (defaults to `active`)
- **account** (*str*) – (optional) the account to allow access to (defaults to `default_account`)

- **threshold** (*int*) – The threshold that needs to be reached by signatures to be able to interact

broadcast (*tx=None*)

Broadcast a transaction to the Steem network

Parameters **tx** (*tx*) – Signed transaction to broadcast

chain_params

clear()

connect (*node=*”, *rpcuser=*”, *rpcpassword=*”, ***kwargs*)

Connect to Steem network (internal use only)

create_account (*account_name*, *creator=None*, *owner_key=None*, *active_key=None*, *memo_key=None*, *posting_key=None*, *password=None*, *additional_owner_keys=[]*, *additional_active_keys=[]*, *additional_posting_keys=[]*, *additional_owner_accounts=[]*, *additional_active_accounts=[]*, *additional_posting_accounts=[]*, *storekeys=True*, *store_owner_key=False*, ***kwargs*)

Create new account on Steem

The brainkey/password can be used to recover all generated keys (see *beembase.account* for more details).

By default, this call will use *default_account* to register a new name *account_name* with all keys being derived from a new brain key that will be returned. The corresponding keys will automatically be installed in the wallet.

Warning: Don't call this method unless you know what you are doing! Be sure to understand what this method does and where to find the private keys for your account.

Note: Please note that this imports private keys (if password is present) into the wallet by default. However, it **does not import the owner key** for security reasons. Do NOT expect to be able to recover it from the wallet if you lose your password!

Parameters

- **account_name** (*str*) – **(required)** new account name
- **registrar** (*str*) – which account should pay the registration fee (defaults to *default_account*)
- **owner_key** (*str*) – Main owner key
- **active_key** (*str*) – Main active key
- **memo_key** (*str*) – Main memo_key
- **password** (*str*) – Alternatively to providing keys, one can provide a password from which the keys will be derived
- **additional_owner_keys** (*array*) – Additional owner public keys
- **additional_active_keys** (*array*) – Additional active public keys
- **additional_owner_accounts** (*array*) – Additional owner account names
- **additional_active_accounts** (*array*) – Additional active account names
- **storekeys** (*bool*) – Store new keys in the wallet (default: True)

Raises `AccountExistsException` – if the account already exists on the blockchain

`custom_json` (*id, json_data, required_auths=[], required_posting_auths=[]*)

Create a custom json operation :param str *id*: identifier for the custom json (max length 32 bytes) :param json *json_data*: the json data to put into the custom_json
operation

Parameters

- **`required_auths` (*list*)** – (optional) required auths
- **`required_posting_auths` (*list*)** – (optional) posting auths

`disallow` (*foreign, permission='posting', account=None, threshold=None, **kwargs*)

Remove additional access to an account by some other public key or account.

Parameters

- **`foreign` (*str*)** – The foreign account that will obtain access
- **`permission` (*str*)** – (optional) The actual permission to modify (defaults to active)
- **`account` (*str*)** – (optional) the account to allow access to (defaults to default_account)
- **`threshold` (*int*)** – The threshold that needs to be reached by signatures to be able to interact

`finalizeOp` (*ops, account, permission, **kwargs*)

This method obtains the required private keys if present in the wallet, finalizes the transaction, signs it and broadcasts it

Parameters

- **`ops` (*operation*)** – The operation (or list of operations) to broadcast
- **`account` (*operation*)** – The account that authorizes the operation
- **`permission` (*string*)** – The required permission for signing (active, owner, posting)
- **`append_to` (*object*)** – This allows to provide an instance of ProposalsBuilder (see `steem.new_proposal()`) or TransactionBuilder (see `steem.new_tx()`) to specify where to put a specific operation.

... note:: `append_to` is exposed to every method used in the `Steem` class

... note:

If ``ops`` is a list of operations, they all need to be signable by the same key! Thus, you cannot combine ops that require active permission with ops that require posting permission. Neither can you use different accounts for different operations!

... note:: This uses `beem.txbuffer` as instance of `beem.transactionbuilder`.
`TransactionBuilder`. You may want to use your own txbuffer

`get_chain_properties` (*use_stored_data=True*)

Return witness elected chain properties

```
:::  
    {'account_creation_fee': '30.000 STEEM', 'maximum_block_size': 65536, 'sbd_interest_rate':  
     250}  
get_config(use_stored_data=True)  
    Returns internal chain configuration.  
get_current_median_history_price(use_stored_data=True)  
    Returns the current median price  
get_dynamic_global_properties(use_stored_data=True)  
    This call returns the dynamic global properties  
get_feed_history(use_stored_data=True)  
    Returns the feed_history  
get_hardfork_version(use_stored_data=True)  
    Current Hardfork Version as String  
get_median_price()  
get_network(use_stored_data=True)  
    Identify the network  
        Returns Network parameters  
        Return type dict  
get_next_scheduled_hardfork(use_stored_data=True)  
    Returns Hardfork and live_time of the hardfork  
get_payout_from_rshares(rshares)  
get_reward_fund(fund_name='post', use_stored_data=True)  
    Get details for a reward fund.  
get_state(path='value')  
get_steam_per_mvest(time_stamp=None)  
info()  
    Returns the global properties  
newWallet(pwd)  
    Create a new wallet. This method is basically only calls beem.wallet.create().  
        Parameters pwd(str) – Password to use for the new wallet  
        Raises beem.exceptions.WalletExists – if there is already a wallet created  
new_tx(*args, **kwargs)  
    Let's obtain a new txbuffer  
        Returns int txid id of the new txbuffer  
prefix  
refresh_data(force_refresh=False)  
register_apis(apis=['network_broadcast', 'account_by_key', 'follow', 'market_history'])  
set_default_account(account)  
    Set the default account to be used  
sign(tx=None, wifis=[])  
    Sign a provided transaction with the provided key(s)
```

Parameters

- **tx** (*dict*) – The transaction to be signed and returned
- **wifs** (*string*) – One or many wif keys to use for signing a transaction. If not present, the keys will be loaded from the wallet as defined in “missing_signatures” key of the transactions.

sp_to_rshares (*sp, voting_power=10000, vote_pct=10000*)

Obtain the r-shares :param number sp: Steem Power :param int voting_power: voting power (100% = 10000) :param int vote_pct: voting participation (100% = 10000)

sp_to_sbd (*sp, voting_power=10000, vote_pct=10000*)

sp_to_vests (*sp, timestamp=None*)

tx()

Returns the default transaction buffer

txbuffer

Returns the currently active tx buffer

unlock (*args, **kwargs)

Unlock the internal wallet

vests_to_sp (*vests, timestamp=None*)

beem.block module

class beem.block.**Block** (*data, klass=None, space_id=1, object_id=None, lazy=False, use_cache=True, id_item=None, steem_instance=None, *args, **kwargs*)
Bases: beem.blockchainobject.BlockchainObject

Read a single block from the chain

Parameters

- **block** (*int*) – block number
- **steem_instance** ([beem.steem.Steem](#)) – Steem instance
- **lazy** (*bool*) – Use lazy loading

Instances of this class are dictionaries that come with additional methods (see below) that allow dealing with a block and its corresponding functions.

```
from beem.block import Block
block = Block(1)
print(block)
```

Note: This class comes with its own caching function to reduce the load on the API server. Instances of this class can be refreshed with `Account.refresh()`.

ops()

ops_statistics (*add_to_ops_stat=None*)

refresh()

Even though blocks never change, you freshly obtain its contents from an API with this method

```
time()
    Return a datetime instance for the timestamp of this block

class beem.block.BlockHeader(data, klass=None, space_id=1, object_id=None, lazy=False,
                             use_cache=True, id_item=None, steem_instance=None, *args,
                             **kwargs)
Bases: beem.blockchainobject.BlockchainObject

refresh()
    Even though blocks never change, you freshly obtain its contents from an API with this method

time()
    Return a datetime instance for the timestamp of this block
```

beem.blockchain module

```
class beem.blockchain.Blockchain(steem_instance=None, mode='irreversible',
                                 data_refresh_time_seconds=900)
Bases: object
```

This class allows to access the blockchain and read data from it

Parameters

- **steem_instance** ([beem.steem.Steem](#)) – Steem instance
- **mode** (*str*) – (default) Irreversible block (`irreversible`) or actual head block (`head`)

This class let's you deal with blockchain related data and methods. Read blockchain related data: .. code-block:: python

```
from beem.blockchain import Blockchain chain = Blockchain()
```

Read current block and blockchain info .. code-block:: python

```
print(chain.get_current_block()) print(chain.info())
```

Monitor for new blocks .. code-block:: python

```
for block in chain.blocks(): print(block)
```

or each operation individually: .. code-block:: python

```
for operations in chain.ops(): print(operations)
```

```
awaitTxConfirmation(transaction, limit=10)
```

Returns the transaction as seen by the blockchain after being included into a block

Note: If you want instant confirmation, you need to instantiate class:`steem.blockchain.Blockchain` with `mode="head"`, otherwise, the call will wait until confirmed in an irreversible block.

Note: This method returns once the blockchain has included a transaction with the **same signature**. Even though the signature is not usually used to identify a transaction, it still cannot be forfeited and is derived from the transaction contented and thus identifies a transaction uniquely.

block_time (*block_num*)

Returns a datetime of the block with the given block number.

Parameters **block_num** (*int*) – Block number

block_timestamp (*block_num*)

Returns the timestamp of the block with the given block number.

Parameters **block_num** (*int*) – Block number

blocks (*start=None*, *stop=None*)

Yields blocks starting from *start*.

Parameters

- **start** (*int*) – Starting block
- **stop** (*int*) – Stop at this block
- **mode** (*str*) – We here have the choice between “head” (the last block) and “irreversible” (the block that is confirmed by 2/3 of all block producers and is thus irreversible)

get_all_accounts (*start=”, stop=”, steps=1000.0*, ***kwargs*)

Yields account names between start and stop.

Parameters

- **start** (*str*) – Start at this account name
- **stop** (*str*) – Stop at this account name
- **steps** (*int*) – Obtain *steps* ret with a single call from RPC

get_current_block()

This call returns the current block

Note: The block number returned depends on the *mode* used when instanciating from this class.

get_current_block_num()

This call returns the current block

Note: The block number returned depends on the *mode* used when instanciating from this class.

ops (*start=None*, *stop=None*, ***kwargs*)

Yields all operations (including virtual operations) starting from *start*.

Parameters

- **start** (*int*) – Starting block
- **stop** (*int*) – Stop at this block
- **mode** (*str*) – We here have the choice between “head” (the last block) and “irreversible” (the block that is confirmed by 2/3 of all block producers and is thus irreversible)
- **only_virtual_ops** (*bool*) – Only yield virtual operations

This call returns a list that only carries one operation and its type!

ops_statistics (*start*, *stop=None*, *add_to_ops_stat=None*, *verbose=True*)

Generates a statistics for all operations (including virtual operations) starting from *start*.

Parameters

- **start** (*int*) – Starting block
- **stop** (*int*) – Stop at this block, if set to None, the current_block_num is taken

:param dict add_to_ops_stat, if set, the result is added to add_to_ops_stat :param bool verbose, if True, the current block number and timestamp is printed This call returns a dict with all possible operations and their occurrence.

stream(*opNames*=[], **args*, ***kwargs*)
Yield specific operations (e.g. comments) only

Parameters

- **opNames** (*array*) – List of operations to filter for
- **start** (*int*) – Start at this block
- **stop** (*int*) – Stop at this block
- **mode** (*str*) – We here have the choice between “head” (the last block) and “irreversible” (the block that is confirmed by 2/3 of all block producers and is thus irreversible)

The dict output is formated such that `type` carries the operation type, timestamp and `block_num` are taken from the block the operation was stored in and the other key depend on the actualy operation.

beem.comment module

class beem.comment.**Comment**(*authorperm*, *full=False*, *lazy=False*, *steem_instance=None*)
Bases: beem.blockchainobject.BlockchainObject

Read data about a Comment/Post in the chain

Parameters

- **authorperm** (*str*) – perm link to post/comment
- **steem_instance** (*steem*) – Steem() instance to use when accesing a RPC

author

authorperm

body

category

comment_options (*options*, *identifier=None*, *account=None*)

Set the comment options :param str identifier: Post identifier :param dict options: The options to define. :param str account: (optional) the account to allow access

to (defaults to `default_account`)

For the options, you have these defaults:::

```
{ "author": "", "permlink": "", "max_accepted_payout": "1000000.000 SBD", "percent_steam_dollars": 10000, "allow_votes": True, "allow_curation_rewards": True,
```

}

downvote (*weight=-100*, *voter=None*)

Downvote the post :param float weight: (optional) Weight for posting (-100.0 - +100.0) defaults to -100.0 :param str voter: (optional) Voting account

edit (*body*, *meta=None*, *replace=False*)

Edit an existing post :param str body: Body of the reply :param json meta: JSON meta object that can be attached to the

post. (optional)

Parameters `replace` (`bool`) – Instead of calculating a *diff*, replace the post entirely (defaults to `False`)

`id`

`is_comment()`

Returns True if post is a comment

`is_main_post()`

Returns True if main post, and False if this is a comment (reply).

`json()`

`json_metadata`

`parent_author`

`parent_permalink`

`permalink`

`post` (`title=None`, `body=None`, `author=None`, `permlink=None`, `reply_identifier=None`,
 `json_metadata=None`, `comment_options=None`, `community=None`, `tags=None`, `beneficiaries=None`, `self_vote=False`)

Create a new post. If this post is intended as a reply/comment, `reply_identifier` needs to be set with the identifier of the parent post/comment (eg. `@author/permalink`). Optionally you can also set `json_metadata`, `comment_options` and upvote the newly created post as an author. Setting category, tags or community will override the values provided in `json_metadata` and/or `comment_options` where appropriate. Args: `title` (str): Title of the post body (str): Body of the post/comment author (str): Account are you posting from `permlink` (str): Manually set the permlink (defaults to None).

If left empty, it will be derived from title automatically.

reply_identifier (str): Identifier of the parent post/comment (only if this post is a reply/comment).

json_metadata (str, dict): JSON meta object that can be attached to the post.

comment_options (str, dict): JSON options object that can be attached to the post.

Example::

```
comment_options = { 'max_accepted_payout': '1000000.000 SBD', 'percent_steam_dollars': 10000, 'allow_votes': True, 'allow_curation_rewards': True, 'extensions': [[0, { 'beneficiaries': [ { 'account': 'account1', 'weight': 5000}, { 'account': 'account2', 'weight': 5000}], }]} ] }
```

community (str): (Optional) Name of the community we are posting into. This will also override the community specified in `json_metadata`.

tags (str, list): (Optional) A list of tags (5 max) to go with the post. This will also override the tags specified in `json_metadata`. The first tag will be used as a ‘category’. If provided as a string, it should be space separated.

beneficiaries (list of dicts): (Optional) A list of beneficiaries for posting reward distribution. This argument overrides beneficiaries as specified in `comment_options`.

For example, if we would like to split rewards between account1 and account2:

```
beneficiaries = [
    {'account': 'account1', 'weight': 5000},
    {'account': 'account2', 'weight': 5000}
]
```

self_vote (bool): (Optional) Upvote the post as author, right after posting.

refresh()

reply (body, title=”, author=”, meta=None)

Reply to an existing post :param str body: Body of the reply :param str title: Title of the reply post :param str author: Author of reply (optional) if not provided

default_user will be used, if present, else a ValueError will be raised.

Parameters **meta (json)** – JSON meta object that can be attached to the post. (optional)

resteem (identifier=None, account=None)

Resteem a post :param str identifier: post identifier (@<account>/<permlink>) :param str account: (optional) the account to allow access

to (defaults to default_account)

title

type_id = 8

upvote (weight=100, voter=None)

Upvote the post :param float weight: (optional) Weight for posting (-100.0 - +100.0) defaults to +100.0 :param str voter: (optional) Voting account

vote (weight, account=None, identifier=None, **kwargs)

Vote for a post :param str identifier: Identifier for the post to upvote Takes

the form @author/permlink

Parameters

- **weight (float)** – Voting weight. Range: -100.0 - +100.0. May not be 0.0
- **account (str)** – Voter to use for voting. (Optional)

If voter is not defines, the default_account will be taken or a ValueError will be raised

class beem.comment.RecentByPath(path='promoted', category=None, steem_instance=None)

Bases: list

Obtain a list of votes for an account

Parameters

- **account (str)** – Account name
- **steem_instance (steem)** – Steem() instance to use when accesing a RPC

class beem.comment.RecentReplies(author, skip_own=True, steem_instance=None)

Bases: list

Obtain a list of recent replies

Parameters

- **author** (*str*) – author
- **steem_instance** (*steem*) – Steem() instance to use when accesing a RPC

beem.discussions module

```
class beem.discussions.Comment_discussions_by_payout (discussion_query,
                                                       steem_instance=None)
Bases: list
get_comment_discussions_by_payout
:param str discussion_query :param steem steem_instance: Steem() instance to use when accesing a RPC
class beem.discussions.Discussions_by_active (discussion_query, steem_instance=None)
Bases: list
get_discussions_by_active
:param str discussion_query :param steem steem_instance: Steem() instance to use when accesing a RPC
class beem.discussions.Discussions_by_blog (discussion_query, steem_instance=None)
Bases: list
get_discussions_by_blog
:param str discussion_query, tag musst be set to a username :param steem steem_instance: Steem() instance to
use when accesing a RPC
class beem.discussions.Discussions_by_cashout (discussion_query,
                                                steem_instance=None)
Bases: list
get_discussions_by_cashout
:param str discussion_query :param steem steem_instance: Steem() instance to use when accesing a RPC
class beem.discussions.Discussions_by_children (discussion_query,
                                                steem_instance=None)
Bases: list
get_discussions_by_children
:param str discussion_query :param steem steem_instance: Steem() instance to use when accesing a RPC
class beem.discussions.Discussions_by_comments (discussion_query,
                                                steem_instance=None)
Bases: list
get_discussions_by_comments
:param str discussion_query :param steem steem_instance: Steem() instance to use when accesing a RPC
class beem.discussions.Discussions_by_created (discussion_query,
                                                steem_instance=None)
Bases: list
get_discussions_by_created
:param str discussion_query :param steem steem_instance: Steem() instance to use when accesing a RPC
class beem.discussions.Discussions_by_feed (discussion_query, steem_instance=None)
Bases: list
get_discussions_by_feed
```

:param str discussion_query, tag must be set to a username :param steem steem_instance: Steem() instance to use when accessing a RPC

```
class beem.discussions.Discussions_by_hot(discussion_query, steem_instance=None)
Bases: list
get_discussions_by_hot
:param str discussion_query :param steem steem_instance: Steem() instance to use when accessing a RPC

class beem.discussions.Discussions_by_payout(discussion_query, steem_instance=None)
Bases: list
get_discussions_by_payout
:param str discussion_query :param steem steem_instance: Steem() instance to use when accessing a RPC

class beem.discussions.Discussions_by_promoted(discussion_query,
                                                steem_instance=None)
Bases: list
get_discussions_by_promoted
:param str discussion_query :param steem steem_instance: Steem() instance to use when accessing a RPC

class beem.discussions.Discussions_by_trending(discussion_query,
                                                steem_instance=None)
Bases: list
get_discussions_by_trending
:param str discussion_query :param steem steem_instance: Steem() instance to use when accessing a RPC

class beem.discussions.Discussions_by_votes(discussion_query, steem_instance=None)
Bases: list
get_discussions_by_votes
:param str discussion_query :param steem steem_instance: Steem() instance to use when accessing a RPC

class beem.discussions.Post_discussions_by_payout(discussion_query,
                                                    steem_instance=None)
Bases: list
get_post_discussions_by_payout
:param str discussion_query :param steem steem_instance: Steem() instance to use when accessing a RPC

class beem.discussions.Query(limit=0, tag='', truncate_body=0)
Bases: dict
```

beem.exceptions module

exception beem.exceptions.WalletLocked
Bases: Exception

Wallet is locked

exception beem.exceptions.WitnessDoesNotExistsException
Bases: Exception

The witness does not exist

exception beem.exceptions.WrongMasterPasswordException
Bases: Exception

The password provided could not properly unlock the wallet
```

beem.market module

```
class beem.market.Market (*args, steem_instance=None, **kwargs)
Bases: dict
```

This class allows to easily access Markets on the blockchain for trading, etc.

Parameters

- **steem_instance** (*steem.steem.Steem*) – Steem instance
- **base** (*steem.asset.Asset*) – Base asset
- **quote** (*steem.asset.Asset*) – Quote asset

Returns

Blockchain Market

Return type

dictionary with overloaded methods

Instances of this class are dictionaries that come with additional methods (see below) that allow dealing with a market and its corresponding functions.

This class tries to identify **two** assets as provided in the parameters in one of the following forms:

- base and quote are valid assets (according to *steem.asset.Asset*)
- base:quote separated with :
- base/quote separated with /
- base-quote separated with -

Note: Throughout this library, the quote symbol will be presented first (e.g. USD:BTS with USD being the quote), while the base only refers to a secondary asset for a trade. This means, if you call `steem.market.Market.sell()` or `steem.market.Market.buy()`, you will sell/buy **only quote** and obtain/pay **only base**.

accountopenorders (`account=None`, `raw_data=False`)

Returns open Orders

Parameters `account` (`steem.account.Account`) – Account name or instance of Account to show orders for in this market

buy (`price`, `amount`, `expiration=None`, `killfill=False`, `account=None`, `orderid=None`, `returnOrderId=False`)
Places a buy order in a given market

Parameters

- `price` (`float`) – price denoted in base/quote
- `amount` (`number`) – Amount of quote to buy
- `expiration` (`number`) – (optional) expiration time of the order in seconds (defaults to 7 days)
- `killfill` (`bool`) – flag that indicates if the order shall be killed if it is not filled (defaults to False)
- `account` (`string`) – Account name that executes that order
- `returnOrderId` (`string`) – If set to “head” or “irreversible” the call will wait for the tx to appear in the head/irreversible block and add the key “orderid” to the tx output

Prices/Rates are denoted in ‘base’, i.e. the USD_BTS market is priced in BTS per USD.

Example: in the USD_BTS market, a price of 300 means a USD is worth 300 BTS

Note: All prices returned are in the **reversed** orientation as the market. I.e. in the BTC/BTS market, prices are BTS per BTC. That way you can multiply prices with *1.05* to get a *+5%*.

Warning: Since buy orders are placed as limit-sell orders for the base asset, you may end up obtaining more of the buy asset than you placed the order for. Example:

- You place an order to buy 10 USD for 100 BTS/USD
- This means that you actually place a sell order for 1000 BTS in order to obtain **at least** 10 USD
- If an order on the market exists that sells USD for cheaper, you will end up with more than 10 USD

cancel (`orderNumbers`, `account=None`, `**kwargs`)

Cancels an order you have placed in a given market. Requires only the “orderNumbers”. An order number takes the form `1.7.xxxx`. :param str orderNumbers: The Order Object id of the form `1.7.xxxx`

get_string (`separator=':'`)

Return a formated string that identifies the market, e.g. USD:BTS

Parameters `separator` (`str`) – The separator of the assets (defaults to `:`)

market_history (*bucket_seconds=300, start_age=3600, end_age=0*)

market_history_buckets()

orderbook (*limit=25, raw_data=False*)

Returns the order book for a given market. You may also specify “all” to get the orderbooks of all markets.
:param int limit: Limit the amount of orders (default: 25) Sample output: .. code-block:: js

```
{‘bids’: [0.003679 USD/BTS (1.9103 USD|519.29602 BTS), 0.003676 USD/BTS (299.9997 USD|81606.16394 BTS), 0.003665 USD/BTS (288.4618 USD|78706.21881 BTS), 0.003665 USD/BTS (3.5285 USD|962.74409 BTS), 0.003665 USD/BTS (72.5474 USD|19794.41299 BTS)], ‘asks’: [0.003738 USD/BTS (36.4715 USD|9756.17339 BTS), 0.003738 USD/BTS (18.6915 USD|5000.00000 BTS), 0.003742 USD/BTS (182.6881 USD|48820.22081 BTS), 0.003772 USD/BTS (4.5200 USD|1198.14798 BTS), 0.003799 USD/BTS (148.4975 USD|39086.59741 BTS)]}
```

Note: Each bid is an instance of class:*steem.price.Order* and thus carries the keys `base`, `quote` and `price`. From those you can obtain the actual amounts for sale

recent_trades (*limit=25, raw_data=False*)

Returns the order book for a given market. You may also specify “all” to get the orderbooks of all markets.

Parameters limit (int) – Limit the amount of orders (default: 25)

Sample output:

```
{‘bids’: [0.003679 USD/BTS (1.9103 USD|519.29602 BTS),  
0.003676 USD/BTS (299.9997 USD|81606.16394 BTS),  
0.003665 USD/BTS (288.4618 USD|78706.21881 BTS),  
0.003665 USD/BTS (3.5285 USD|962.74409 BTS),  
0.003665 USD/BTS (72.5474 USD|19794.41299 BTS)],  
‘asks’: [0.003738 USD/BTS (36.4715 USD|9756.17339 BTS),  
0.003738 USD/BTS (18.6915 USD|5000.00000 BTS),  
0.003742 USD/BTS (182.6881 USD|48820.22081 BTS),  
0.003772 USD/BTS (4.5200 USD|1198.14798 BTS),  
0.003799 USD/BTS (148.4975 USD|39086.59741 BTS)]}
```

Note: Each bid is an instance of class:*steem.price.Order* and thus carries the keys `base`, `quote` and `price`. From those you can obtain the actual amounts for sale

sell (*price, amount, expiration=None, killfill=False, account=None, orderid=None, returnOrderId=False*)

Places a sell order in a given market

Parameters

- **price** (*float*) – price denoted in `base/quote`
- **amount** (*number*) – Amount of `quote` to sell
- **expiration** (*number*) – (optional) expiration time of the order in seconds (defaults to 7 days)
- **killfill** (*bool*) – flag that indicates if the order shall be killed if it is not filled (defaults to False)
- **account** (*string*) – Account name that executes that order

- **returnOrderId** (*string*) – If set to “head” or “irreversible” the call will wait for the tx to appear in the head/irreversible block and add the key “orderid” to the tx output

Prices/Rates are denoted in ‘base’, i.e. the USD_BTS market is priced in BTS per USD.

Example: in the USD_BTS market, a price of 300 means a USD is worth 300 BTS

Note: All prices returned are in the **reversed** orientation as the market. I.e. in the BTC/BTS market, prices are BTS per BTC. That way you can multiply prices with *1.05* to get a +5%.

ticker (*raw_data=False*)

Returns the ticker for all markets.

Output Parameters:

- **last**: Price of the order last filled
- **lowestAsk**: Price of the lowest ask
- **highestBid**: Price of the highest bid
- **baseVolume**: Volume of the base asset
- **quoteVolume**: Volume of the quote asset
- **percentChange**: 24h change percentage (in %)
- **settlement_price**: Settlement Price for borrow/settlement
- **core_exchange_rate**: Core exchange rate for payment of fee in non-BTS asset
- **price24h**: the price 24h ago

Sample Output:

```
{  
    {  
        "quoteVolume": 48328.73333,  
        "quoteSettlement_price": 332.3344827586207,  
        "lowestAsk": 340.0,  
        "baseVolume": 144.1862,  
        "percentChange": -1.9607843231354893,  
        "highestBid": 334.2000000000005,  
        "latest": 333.3333330133934,  
    }  
}
```

trades (*limit=25, start=None, stop=None, raw_data=False*)

Returns your trade history for a given market.

Parameters

- **limit** (*int*) – Limit the amount of orders (default: 25)
- **start** (*datetime*) – start time
- **stop** (*datetime*) – stop time

volume24h (*raw_data=False*)

Returns the 24-hour volume for all markets, plus totals for primary currencies.

Sample output:

```
{
    "BTS": 361666.63617,
    "USD": 1087.0
}
```

beem.memo module

class beem.memo.**Memo** (*from_account=None, to_account=None, steem_instance=None*)
 Bases: object

Deals with Memos that are attached to a transfer

Parameters

- **from_account** (beem.account.Account) – Account that has sent the memo
- **to_account** (beem.account.Account) – Account that has received the memo
- **steem_instance** (beem.steem.Steem) – Steem instance

A memo is encrypted with a shared secret derived from a private key of the sender and a public key of the receiver. Due to the underlying mathematics, the same shared secret can be derived by the private key of the receiver and the public key of the sender. The encrypted message is perturbed by a nonce that is part of the transmitted message.

```
from beem.memo import Memo
m = Memo("steemeu", "wallet.xeroc")
m.steem.wallet.unlock("secret")
enc = (m.encrypt("foobar"))
print(enc)
>> {'nonce': '17329630356955254641', 'message': '8563e2bb2976e0217806d642901a2855
˓→'}
print(m.decrypt(enc))
>> foobar
```

To decrypt a memo, simply use

```
from beem.memo import Memo
m = Memo()
m.steem.wallet.unlock("secret")
print(memo.decrypt(op_data["memo"]))
```

if op_data being the payload of a transfer operation.

In BitShares, memos are AES-256 encrypted with a shared secret between sender and receiver. It is derived from the memo private key of the sender and the memo public key of the receiver.

In order for the receiver to decode the memo, the shared secret has to be derived from the receiver's private key and the senders public key.

The memo public key is part of the account and can be retrieved with the *get_account* call:

```
get_account <accountname>
{
    [...]
    "options": {
        "memo_key": "GPH5TPTziKkLexhVKsQKtSpo4bAv5RnB8oXcG4sMHEwCcTf3r7dqE",
    [...]
```

(continues on next page)

(continued from previous page)

```
},
[...]
}
```

while the memo private key can be dumped with `dump_private_keys`

The take the following form:

```
{
    "from": "GPH5mgup8evDqMnT86L7scVebRYDC2fwAWmygPEUL43LjstQegYCC",
    "to": "GPH5Ar4j53kFWuEZQ9XhbAja4YXMPJ2EnUg5QcrdeMFYUNMMNJbe",
    "nonce": "13043867485137706821",
    "message": "d55524c37320920844ca83bb20c8d008"
}
```

The fields `from` and `to` contain the memo public key of sender and receiver. The `nonce` is a random integer that is used for the seed of the AES encryption of the message.

The high level memo class makes use of the pysteem wallet to obtain keys for the corresponding accounts.

```
from beem.memo import Memo
from beem.account import Account

memoObj = Memo(
    from_account=Account(from_account),
    to_account=Account(to_account)
)
encrypted_memo = memoObj.encrypt(memo)
```

```
from getpass import getpass
from beem.block import Block
from beem.memo import Memo

# Obtain a transfer from the blockchain
block = Block(23755086)                                # block
transaction = block["transactions"][3]                  # transactions
op = transaction["operations"][0]                      # operation
op_id = op[0]                                         # operation type
op_data = op[1]                                         # operation payload

# Instantiate Memo for decoding
memo = Memo()

# Unlock wallet
memo.unlock_wallet(getpass())

# Decode memo
# Raises exception if required keys not available in the wallet
print(memo.decrypt(op_data["memo"]))
```

decrypt(memo)

Decrypt a memo

Parameters `memo` (`str`) – encrypted memo message

Returns encrypted memo

Return type str

encrypt (memo)

Encrypt a memo

Parameters `memo` (`str`) – clear text memo message**Returns** encrypted memo**Return type** `str`**unlock_wallet (*args, **kwargs)**

Unlock the library internal wallet

beem.message module**class beem.message.Message (message, steem_instance=None)**Bases: `object`**sign (account=None, **kwargs)**

Sign a message with an account's memo key

Parameters `account` (`str`) – (optional) the account that owns the bet (defaults to `default_account`)**Returns** the signed message encapsulated in a known format**verify (**kwargs)**

Verify a message with an account's memo key

Parameters `account` (`str`) – (optional) the account that owns the bet (defaults to `default_account`)**Returns** True if the message is verified successfully:raises `InvalidMessageSignature` if the signature is not ok**beem.notify module****class beem.notify.Notify (on_block=None, only_block_id=False, steem_instance=None, keep_alive=25)**Bases: `events.events.Events`

Notifications on Blockchain events.

This modules allows you to be notified of events taking place on the blockchain.

Parameters

- `on_block` (`fnt`) – Callback that will be called for each block received
- `steem_instance` (`beem.steem.Steem`) – Steem instance

Example

```
from pprint import pprint
from beem.notify import Notify

notify = Notify(
    on_block=print,
)
notify.listen()
```

close()

Cleanly close the Notify instance

listen()

This call initiates the listening/notification process. It behaves similar to `run_forever()`.

process_block(message)

reset_subscriptions(accounts=[])

Change the subscriptions of a running Notify instance

beem.price module

class beem.price.FilledOrder(order, steem_instance=None, **kwargs)

Bases: `beem.price.Price`

This class inherits `steem.price.Price` but has the base and quote Amounts not only be used to represent the price (as a ratio of base and quote) but instead has those amounts represent the amounts of an actually filled order!

Parameters `steem_instance` (`steem.steem.Steem`) – Steem instance

Note: Instances of this class come with an additional `time` key that shows when the order has been filled!

class beem.price.Order(*args, steem_instance=None, **kwargs)

Bases: `beem.price.Price`

This class inherits `steem.price.Price` but has the base and quote Amounts not only be used to represent the price (as a ratio of base and quote) but instead has those amounts represent the amounts of an actual order!

Parameters `steem_instance` (`steem.steem.Steem`) – Steem instance

Note: If an order is marked as deleted, it will carry the ‘deleted’ key which is set to `True` and all other data be `None`.

class beem.price.Price(*args, base=None, quote=None, base_asset=None, steem_instance=None)

Bases: `dict`

This class deals with all sorts of prices of any pair of assets to simplify dealing with the tuple:

(quote, base)

each being an instance of `beem.amount.Amount`. The amount themselves define the price.

Note: The price (floating) is derived as `base/quote`

Parameters

- `args (list)` – Allows to deal with different representations of a price
- `base (beem.asset.Asset)` – Base asset
- `quote (beem.asset.Asset)` – Quote asset
- `steem_instance (beem.steem.Steem)` – Steem instance

Returns All data required to represent a price

Return type dict

Way to obtain a proper instance:

- args is a str with a price and two assets
- args can be a floating number and base and quote being instances of `beem.asset.Asset`
- args can be a floating number and base and quote being instances of str
- args can be dict with keys price, base, and quote (*graphene balances*)
- args can be dict with keys base and quote
- args can be dict with key receives (filled orders)
- args being a list of [quote, base] both being instances of `beem.amount.Amount`
- args being a list of [quote, base] both being instances of str (amount symbol)
- base and quote being instances of `beem.asset.Amount`

This allows instantiations like:

- `Price("0.315 SBD/STEEM")`
- `Price(0.315, base="SBD", quote="STEEM")`
- `Price(0.315, base=Asset("SBD"), quote=Asset("STEEM"))`
- `Price({"base": {"amount": 1, "asset_id": "SBD"}, "quote": {"amount": 10, "asset_id": "SBD"}})`
- `Price(quote="10 STEEM", base="1 SBD")`
- `Price("10 STEEM", "1 SBD")`
- `Price(Amount("10 STEEM"), Amount("1 SBD"))`
- `Price(1.0, "SBD/STEEM")`

Instances of this class can be used in regular mathematical expressions (+-*%) such as:

```
>>> from beem.price import Price
>>> Price("0.3314 SBD/STEEM") * 2
0.662600000 SBD/STEEM
```

as_base(base)

Returns the price instance so that the base asset is base.

Note: This makes a copy of the object!

as_quote(quote)

Returns the price instance so that the quote asset is quote.

Note: This makes a copy of the object!

copy() → a shallow copy of D

invert()

Invert the price (e.g. go from SBD/STEEM into STEEM/SBD)

json()

market

Open the corresponding market

Returns Instance of `steem.market.Market` for the corresponding pair of assets.

```
symbols()
class beem.price.PriceFeed(feed, steem_instance=None)
Bases: dict
```

This class is used to represent a price feed consisting of

- a witness,
- a symbol,
- a core exchange rate,
- the maintenance collateral ratio,
- the max short squeeze ratio,
- a settlement price, and
- a date

Parameters `steem_instance` (`steem.steem.Steem`) – Steem instance

```
class beem.price.UpdateCallOrder(call, steem_instance=None, **kwargs)
Bases: beem.price.Price
```

This class inherits `steem.price.Price` but has the `base` and `quote` Amounts not only be used to represent the **call price** (as a ratio of base and quote).

Parameters `steem_instance` (`steem.steem.Steem`) – Steem instance

beem.storage module

```
class beem.storage.Configuration
Bases: beem.storage.DataDir
```

This is the configuration storage that stores key/value pairs in the `config` table of the SQLite3 database.

```
checkBackup()
    Backup the SQL database every 7 days
config_defaults = {'node': ['wss://steemd.pevo.science', 'wss://gtg.steem.house:8090']}
create_table()
    Create the new table in the SQLite database
delete(key)
    Delete a key from the configuration store
exists_table()
    Check if the database table exists
get(key, default=None)
    Return the key if exists or a default value
items()
nodes = ['wss://steemd.pevo.science', 'wss://gtg.steem.house:8090', 'wss://rpc.steemli...']
    Default configuration
```

```
class beem.storage.DataDir
Bases: object
```

This class ensures that the user's data is stored in its OS preotected user directory:

OSX:

- *~/Library/Application Support/<AppName>*

Windows:

- *C:Documents and Settings<User>Application DataLocal Settings<AppAuthor><AppName>*
- *C:Documents and Settings<User>Application Data<AppAuthor><AppName>*

Linux:

- *~/.local/share/<AppName>*

Furthermore, it offers an interface to generated backups in the *backups/* directory every now and then.

```
appauthor = 'beem'
appname = 'beem'
clean_data()
    Delete files older than 70 days
data_dir = '/home/docs/.local/share/beem'
mkdir_p()
    Ensure that the directory in which the data is stored exists
refreshBackup()
    Make a new backup
sqlDataBaseFile = '/home/docs/.local/share/beem/beem.sqlite'
sqlite3_backup(dbfile, backupdir)
    Create timestamped database copy
storageDatabase = 'beem.sqlite'
```

```
class beem.storage.Key
Bases: beem.storage.DataDir
```

This is the key storage that stores the public key and the (possibly encrypted) private key in the *keys* table in the SQLite3 database.

```
add(wif, pub)
```

Add a new public/private key pair (correspondence has to be checked elsewhere!)

Parameters

- **pub** (*str*) – Public key
- **wif** (*str*) – Private key

```
create_table()
    Create the new table in the SQLite database
```

```
delete(pub)
    Delete the key identified as pub
```

Parameters **pub** (*str*) – Public key

```
exists_table()
    Check if the database table exists

getPrivateKeyForPublicKey (pub)
    Returns the (possibly encrypted) private key that corresponds to a public key

    Parameters pub (str) – Public key

    The encryption scheme is BIP38

getPublicKeys()
    Returns the public keys stored in the database

updateWif (pub, wif)
    Change the wif to a pubkey

    Parameters
        • pub (str) – Public key
        • wif (str) – Private key

class beem.storage.MasterPassword (password)
Bases: object

The keys are encrypted with a Masterpassword that is stored in the configurationStore. It has a checksum to verify correctness of the password

changePassword (newpassword)
    Change the password

config_key = 'encrypted_master_password'
    This key identifies the encrypted master password stored in the confirmation

decryptEncryptedMaster()
    Decrypt the encrypted masterpassword

decrypted_master = ''

deriveChecksum (s)
    Derive the checksum

getEncryptedMaster()
    Obtain the encrypted masterkey

newMaster()
    Generate a new random masterpassword

password = ''

purge()
    Remove the masterpassword from the configuration store

saveEncrytpedMaster()
    Store the encrypted master password in the configuration store
```

beem.transactionbuilder module

```
class beem.transactionbuilder.TransactionBuilder (tx={}, proposer=None, expiration=None, steem_instance=None)
Bases: dict
```

This class simplifies the creation of transactions by adding operations and signers. To build your own transactions and sign them

```
from beem.transactionbuilder import TransactionBuilder
from beembase.operations import Transfer
tx = TransactionBuilder()
tx.appendOps(Transfer(**{
    "from": "test",
    "to": "test1",
    "amount": "1 STEEM",
    "memo": ""
}))
tx.appendSigner("test", "active")
tx.sign()
tx.broadcast()
```

addSigningInformation (*account, permission*)

This is a private method that adds side information to a unsigned/partial transaction in order to simplify later signing (e.g. for multisig or coldstorage)

FIXME: Does not work with owner keys!

appendMissingSignatures ()

Store which accounts/keys are supposed to sign the transaction

This method is used for an offline-signer!

appendOps (*ops, append_to=None*)

Append op(s) to the transaction builder

Parameters **ops** (*list*) – One or a list of operations

appendSigner (*account, permission*)

Try to obtain the wif key from the wallet by telling which account and permission is supposed to sign the transaction

appendWif (*wif*)

Add a wif that should be used for signing of the transaction.

broadcast ()

Broadcast a transaction to the steem network

Parameters **tx** (*tx*) – Signed transaction to broadcast

clear ()

Clear the transaction builder and start from scratch

constructTx ()

Construct the actual transaction and store it in the class's dict store

get_parent ()

TransactionBuilders don't have parents, they are their own parent

is_empty ()

json ()

Show the transaction as plain json

list_operations ()

set_expiration (*p*)

sign ()

Sign a provided transaction with the provided key(s)

Parameters

- **tx** (*dict*) – The transaction to be signed and returned
- **wifs** (*string*) – One or many wif keys to use for signing a transaction. If not present, the keys will be loaded from the wallet as defined in “missing_signatures” key of the transactions.

`verify_authority()`

Verify the authority of the signed transaction

beem.utils module

`beem.utils.assets_from_string(text)`

Correctly split a string containing an asset pair.

Splits the string into two assets with the separator being one of the following: :, /, or -.

`beem.utils.construct_authorperm(*args, username_prefix='@')`

Create a post identifier from comment/post object or arguments. Examples:

`beem.utils.construct_authorpermvoter(*args, username_prefix='@')`

Create a vote identifier from vote object or arguments. Examples:

`beem.utils.derive_permalink(title, parent_permalink=None, parent_author=None)`

`beem.utils.formatTime(t)`

Properly Format Time for permlinks

`beem.utils.formatTimeFromNow(secs=0)`

Properly Format Time that is *x* seconds in the future

Parameters **secs** (*int*) – Seconds to go in the future (*x>0*) or the past (*x<0*)

Returns Properly formated time for Graphene (%Y-%m-%dT%H:%M:%S)

Return type str

`beem.utils.formatTimeString(t)`

Properly Format Time for permlinks

`beem.utils.keep_in_dict(obj, allowed_keys=[])`

Prune a class or dictionary of all but allowed keys.

`beem.utils.make_patch(a, b, n=3)`

`beem.utils.parse_time(block_time)`

Take a string representation of time from the blockchain, and parse it into datetime object.

`beem.utils.remove_from_dict(obj, remove_keys=[])`

Prune a class or dictionary of specified keys.

`beem.utils.resolve_authorperm(identifier)`

Correctly split a string containing an authorperm.

Splits the string into author and permalink with the following separator: /.

`beem.utils.resolve_authorpermvoter(identifier)`

Correctly split a string containing an authorpermvoter.

Splits the string into author and permalink with the following separator: / and |.

```
beem.utils.resolve_root_identifier(url)
beem.utils.sanitize_permalink(permalink)
beem.utils.test_proposal_in_buffer(buf, operation_name, id)
```

beem.vote module

class beem.vote.AccountVotes(*account*, steem_instance=None)

Bases: list

Obtain a list of votes for an account

Parameters

- **account** (*str*) – Account name
- **steem_instance** (*steem*) – Steem() instance to use when accesing a RPC

class beem.vote.ActiveVotes(*authorperm*, steem_instance=None)

Bases: list

Obtain a list of votes for a post

Parameters

- **authorperm** (*str*) – authorperm link
- **steem_instance** (*steem*) – Steem() instance to use when accesing a RPC

class beem.vote.Vote(*voter*, authorperm=None, full=False, lazy=False, steem_instance=None)

Bases: beem.blockchainobject.BlockchainObject

Read data about a Vote in the chain

Parameters

- **authorperm** (*str*) – perm link to post/comment
- **steem_instance** (*steem*) – Steem() instance to use when accesing a RPC

```
from beem.vote import Vote
v = Vote("theaussiegae/cryptokittie-giveaway-number-2 | ")
```

authorpermvoter

```
json()
percent
refresh()
reputation
rshares
time
type_id = 11
voter
weight
```

beem.wallet module

```
class beem.wallet.Wallet(rpc=None, *args, **kwargs)
Bases: object
```

The wallet is meant to maintain access to private keys for your accounts. It either uses manually provided private keys or uses a SQLite database managed by storage.py.

Parameters

- **rpc** ([SteemNodeRPC](#)) – RPC connection to a Steem node
- **keys** (*array, dict, string*) – Predefine the wif keys to shortcut the wallet database

Three wallet operation modes are possible:

- **Wallet Database:** Here, beem loads the keys from the locally stored wallet SQLite database (see `storage.py`). To use this mode, simply call `Steem()` without the `keys` parameter
- **Providing Keys:** Here, you can provide the keys for your accounts manually. All you need to do is add the wif keys for the accounts you want to use as a simple array using the `keys` parameter to `Steem()`.
- **Force keys:** This mode is for advanced users and requires that you know what you are doing. Here, the `keys` parameter is a dictionary that overwrite the `active`, `owner`, `posting` or `memo` keys for any account. This mode is only used for *foreign* signatures!

A new wallet can be created by using:

```
from beem import Steem
steem = Steem()
steem.wallet.purgeWallet()
steem.wallet.create("supersecret-passphrase")
```

This will raise an exception if you already have a wallet installed.

The wallet can be unlocked for signing using

```
from beem import Steem
steem = Steem()
steem.wallet.unlock("supersecret-passphrase")
```

A private key can be added by using the `steem.wallet.Wallet.addPrivateKey()` method that is available **after** unlocking the wallet with the correct passphrase:

```
from beem import Steem
steem = Steem()
steem.wallet.unlock("supersecret-passphrase")
steem.wallet.addPrivateKey("5xxxxxxxxxxxxxxxxxxxx")
```

Note: The private key has to be either in hexadecimal or in wallet import format (wif) (starting with a 5).

MasterPassword = None

addPrivateKey(wif)

Add a private key to the wallet database

changePassphrase(new_pwd)

Change the passphrase for the wallet database

configStorage = None

```
create (pwd)
    Alias for newWallet()

created()
    Do we have a wallet database already?

decrypt_wif (encwif)
    decrypt a wif key

encrypt_wif (wif)
    Encrypt a wif key

getAccount (pub)
    Get the account data for a public key (first account found for this public key)

getAccountFromPrivateKey (wif)
    Obtain account name from private key

getAccountFromPublicKey (pub)
    Obtain the first account name from public key

getAccounts()
    Return all accounts installed in the wallet database

getAccountsFromPublicKey (pub)
    Obtain all accounts associated with a public key

getActiveKeyForAccount (name)
    Obtain owner Active Key for an account from the wallet database

getAllAccounts (pub)
    Get the account data for a public key (all accounts found for this public key)

getKeyType (account, pub)
    Get key type

getMemoKeyForAccount (name)
    Obtain owner Memo Key for an account from the wallet database

getOwnerKeyForAccount (name)
    Obtain owner Private Key for an account from the wallet database

getPrivateKeyForPublicKey (pub)
    Obtain the private key for a given public key

Parameters pub (str) – Public Key

getPublicKeys()
    Return all installed public keys

keyMap = {}

keyStorage = None

keys = {}

lock()
    Lock the wallet database

locked()
    Is the wallet database locked?

masterpassword = None
```

```
newWallet (pwd)
    Create a new wallet database

purge ()
    Alias for purgeWallet()

purgeWallet ()
    Purge all data in wallet database

removeAccount (account)
    Remove all keys associated with a given account

removePrivateKeyFromPublicKey (pub)
    Remove a key from the wallet database

rpc = None

setKeys (loadkeys)
    This method is strictly only for in memory keys that are passed to Wallet/Steem with the keys argument

tryUnlockFromEnv ()

unlock (pwd=None)
    Unlock the wallet database

unlocked ()
    Is the wallet database unlocked?
```

beem.witness module

```
class beem.witness.LookupWitnesses (from_account, limit, steem_instance=None)
Bases: beem.witness.WitnessesObject
```

Obtain a list of witnesses which have been voted by an account

Parameters

- **from_account** (str) – Account name
- **steem_instance** (steem) – Steem() instance to use when accesing a RPC

```
class beem.witness.Witness (owner, id_item='owner', full=False, lazy=False,
                                steem_instance=None)
Bases: beem.blockchainobject.BlockchainObject
```

Read data about a witness in the chain

Parameters

- **account_name** (str) – Name of the witness
- **steem_instance** (steem) – Steem() instance to use when accesing a RPC

```
from beem.witness import Witness
Witness("gtg")
```

account

```
feed_publish (base, quote='1.000 STEEM', account=None)
```

Publish a feed price as a witness. :param float base: USD Price of STEEM in SBD (implied price) :param float quote: (optional) Quote Price. Should be 1.000, unless we are adjusting the feed to support the peg. :param str account: (optional) the source account for the transfer if not self["owner"]

```
refresh ()
```

```
type_id = 3
update(signing_key, url, props, account=None)
    Update witness :param pubkey signing_key: Signing key :param str url: URL :param dict props: Properties
    :param str account: (optional) witness account name
```

Properties:::

```
{ "account_creation_fee": x, "maximum_block_size": x, "sbd_interest_rate": x,
}
```

```
class beem.witness.Witnesses(steem_instance=None)
Bases: beem.witness.WitnessesObject
```

Obtain a list of **active** witnesses and the current schedule

Parameters **steem_instance** (steem) – Steem() instance to use when accesing a RPC

```
class beem.witness.WitnessesByIds(witness_ids, steem_instance=None)
Bases: beem.witness.WitnessesObject
```

Obtain a list of witnesses which have been voted by an account

Parameters

- **witness_ids** (list) – list of witness_ids
- **steem_instance** (steem) – Steem() instance to use when accesing a RPC

```
class beem.witness.WitnessesObject
Bases: list
```

printAsTable (sort_key='votes', reverse=True)

```
class beem.witness.WitnessesRankedByVote(from_account="",
                                         limit=100,
                                         steem_instance=None)
Bases: beem.witness.WitnessesObject
```

Obtain a list of witnesses ranked by Vote

Parameters

- **from_account** (str) – Witness name
- **steem_instance** (steem) – Steem() instance to use when accesing a RPC

```
class beem.witness.WitnessesVotedByAccount(account, steem_instance=None)
Bases: beem.witness.WitnessesObject
```

Obtain a list of witnesses which have been voted by an account

Parameters

- **account** (str) – Account name
- **steem_instance** (steem) – Steem() instance to use when accesing a RPC

Module contents

4.2 beembase

4.2.1 beembase package

Submodules

beembase.account module

class beembase.account.**Address**(*args, **kwargs)

Bases: graphenebase.account.Address

Address class

This class serves as an address representation for Public Keys.

Parameters

- **address** (*str*) – Base58 encoded address (defaults to None)
- **pubkey** (*str*) – Base58 encoded pubkey (defaults to None)
- **prefix** (*str*) – Network prefix (defaults to STM)

Example:

```
Address ("GPHFN9r6VYzBK8EKtMewfNbfiGCr56pHDBFi")
```

class beembase.account.**BrainKey**(*args, **kwargs)

Bases: graphenebase.account.BrainKey

Brainkey implementation similar to the graphene-ui web-wallet.

Parameters

- **brainkey** (*str*) – Brain Key
- **sequence** (*int*) – Sequence number for consecutive keys

Keys in Graphene are derived from a seed brain key which is a string of 16 words out of a predefined dictionary with 49744 words. It is a simple single-chain key derivation scheme that is not compatible with BIP44 but easy to use.

Given the brain key, a private key is derived as:

```
privkey = SHA256(SHA512(brainkey + " " + sequence))
```

Incrementing the sequence number yields a new key that can be regenerated given the brain key.

class beembase.account.**PasswordKey**(*args, **kwargs)

Bases: graphenebase.account.PasswordKey

This class derives a private key given the account name, the role and a password. It leverages the technology of Brainkeys and allows people to have a secure private key by providing a passphrase only.

class beembase.account.**PrivateKey**(*args, **kwargs)

Bases: graphenebase.account.PrivateKey

Derives the compressed and uncompressed public keys and constructs two instances of PublicKey:

Parameters

- **wif** (*str*) – Base58check-encoded wif key
- **prefix** (*str*) – Network prefix (defaults to STM)

Example::

```
PrivateKey("5HqUkGuo62BfcJU5vNhTXKJRXuUi9QSE6jp8C3uBJ2BVhtB8Wsd")
```

Compressed vs. Uncompressed:

- **PrivateKey("w-i-f").pubkey**: Instance of PublicKey using compressed key.
- **PrivateKey("w-i-f").pubkey.address**: Instance of Address using compressed key.
- **PrivateKey("w-i-f").uncompressed**: Instance of PublicKey using uncompressed key.
- **PrivateKey("w-i-f").uncompressed.address**: Instance of Address using uncompressed key.

class beembase.account.**PublicKey**(*args, **kwargs)

Bases: graphenebase.account.PublicKey

This class deals with Public Keys and inherits Address.

Parameters

- **pk** (*str*) – Base58 encoded public key
- **prefix** (*str*) – Network prefix (defaults to STM)

Example::

```
PublicKey("GPH6UtYWWs3rkZGV8JA86qrgkG6tyFksgECefKE1MiH4HkLD8PFGL")
```

Note: By default, graphene-based networks deal with **compressed** public keys. If an **uncompressed** key is required, the method `unCompressed` can be used:

```
PublicKey("xxxxxx").unCompressed()
```

beembase.bip38 module

beembase.bip38.**decrypt** (*encrypted_privkey*, *passphrase*)

BIP0038 non-ec-multiply decryption. Returns WIF pubkey.

Parameters

- **encrypted_privkey** (*Base58*) – Private key
- **passphrase** (*str*) – UTF-8 encoded passphrase for decryption

Returns BIP0038 non-ec-multiply decrypted key

Return type Base58

Raises `SaltException` – if checksum verification failed (e.g. wrong password)

beembase.bip38.**encrypt** (*privkey*, *passphrase*)

BIP0038 non-ec-multiply encryption. Returns BIP0038 encrypted pubkey.

Parameters

- **privkey** (*Base58*) – Private key

- **passphrase** (*str*) – UTF-8 encoded passphrase for encryption

Returns BIP0038 non-ec-multiply encrypted wif key

Return type Base58

beembase.chains module

beembase.memo module

beembase.memo.**decode_memo** (*priv, pub, nonce, message*)

Decode a message with a shared secret between Alice and Bob

Parameters

- **priv** ([PrivateKey](#)) – Private Key (of Bob)
- **pub** ([PublicKey](#)) – Public Key (of Alice)
- **nonce** (*int*) – Nonce used for Encryption
- **message** (*bytes*) – Encrypted Memo message

Returns Decrypted message

Return type str

Raises `ValueError` – if message cannot be decoded as valid UTF-8 string

beembase.memo.**encode_memo** (*priv, pub, nonce, message*)

Encode a message with a shared secret between Alice and Bob

Parameters

- **priv** ([PrivateKey](#)) – Private Key (of Alice)
- **pub** ([PublicKey](#)) – Public Key (of Bob)
- **nonce** (*int*) – Random nonce
- **message** (*str*) – Memo message

Returns Encrypted message

Return type hex

beembase.memo.**get_shared_secret** (*priv, pub*)

Derive the share secret between *priv* and *pub*

Parameters

- **priv** ([Base58](#)) – Private Key
- **pub** ([Base58](#)) – Public Key

Returns Shared secret

Return type hex

The shared secret is generated such that:

```
Pub(Alice) * Priv(Bob) = Pub(Bob) * Priv(Alice)
```

beembase.memo.**init_aes** (*shared_secret, nonce*)

Initialize AES instance

Parameters

- **shared_secret** (*hex*) – Shared Secret to use as encryption key
- **nonce** (*int*) – Random nonce

Returns AES instance

Return type AES

beembase.objects module

```
beembase.objects.AccountId(asset)

class beembase.objects.AccountOptions(*args, **kwargs)
    Bases: graphenebase.objects.GrapheneObject

class beembase.objects.Amount(d)
    Bases: object

beembase.objects.AssetId(asset)

class beembase.objects.Beneficiaries(*args, **kwargs)
    Bases: graphenebase.objects.GrapheneObject

class beembase.objects.Beneficiary(*args, **kwargs)
    Bases: graphenebase.objects.GrapheneObject

class beembase.objects.CommentOptionExtensions(o)
    Bases: graphenebase.types.Static_variant
    Serialize Comment Payout Beneficiaries. Args:
        beneficiaries (list): A static_variant containing beneficiaries.
```

Example:

```
::

[0,
 {'beneficiaries': [ {'account': 'furion', 'weight': 10000}
 ]}

class beembase.objects.ExchangeRate(*args, **kwargs)
    Bases: graphenebase.objects.GrapheneObject

class beembase.objects.Extension(d)
    Bases: graphenebase.types.Array

class beembase.objects.Memo(*args, **kwargs)
    Bases: graphenebase.objects.GrapheneObject

class beembase.objects.ObjectId(object_str, type_verify=None)
    Bases: graphenebase.types.ObjectId
    Encodes object/protocol ids

class beembase.objects.Operation(*args, **kwargs)
    Bases: graphenebase.objects.Operation
```

```
getOperationNameForId(i)
    Convert an operation id into the corresponding string

json()
operations()

class beembase.objects.Permission(*args, **kwargs)
Bases: graphenebase.objects.GrapheneObject

class beembase.objects.Price(*args, **kwargs)
Bases: graphenebase.objects.GrapheneObject

class beembase.objects.WitnessProps(*args, **kwargs)
Bases: graphenebase.objects.GrapheneObject
```

beembase.objecttypes module

```
beembase.objecttypes.object_type = {'account': 2, 'account_history': 18, 'block_summary': 1}
Object types for object ids
```

beembase.operationids module

```
beembase.operationids.getOperationNameForId(i)
    Convert an operation id into the corresponding string
```

```
beembase.operationids.ops = ['vote', 'comment', 'transfer', 'transfer_to_vesting', 'withdraw']
Operation ids
```

beembase.operations module

```
beembase.operationids.getOperationNameForId(i)
    Convert an operation id into the corresponding string
```

```
beembase.operationids.ops = ['vote', 'comment', 'transfer', 'transfer_to_vesting', 'withdraw']
Operation ids
```

beembase.transactions module

Module contents

4.3 beemapi

4.3.1 beemapi package

Submodules

SteemNodeRPC

This class allows to call API methods exposed by the witness node via websockets.

Definition

```
class beemapi.steemnoderpc.SteemNodeRPC(*args, **kwargs)
```

This class allows to call API methods exposed by the witness node via websockets.

```
__getattr__(name)
```

Map all methods to RPC calls and pass through the arguments

```
rpceexec(payload)
```

Execute a call by sending the payload. It makes use of the GrapheneRPC library. In here, we mostly deal with Steem specific error handling

Parameters **payload**(json) – Payload data

Raises

- **ValueError** – if the server does not respond in proper JSON format
- **RPCError** – if the server returns an error

beemapi.exceptions module

```
exception beemapi.exceptions.MissingRequiredActiveAuthority
```

Bases: grapheneapi.exceptions.RPCError

```
exception beemapi.exceptions.NoAccessApi
```

Bases: grapheneapi.exceptions.RPCError

```
exception beemapi.exceptions.NoMethodWithName
```

Bases: grapheneapi.exceptions.RPCError

```
exception beemapi.exceptions.NumRetriesReached
```

Bases: Exception

```
exception beemapi.exceptions.UnhandledRPCError
```

Bases: grapheneapi.exceptions.RPCError

```
beemapi.exceptions.decodeRPCErrorMsg(e)
```

Helper function to decode the raised Exception and give it a python Exception class

SteemWebsocket

This class allows subscribe to push notifications from the Steem node.

```
from pprint import pprint
from beemapi.websocket import SteemWebsocket

ws = SteemWebsocket(
    "wss://gtg.steem.house:8090",
    accounts=["test"],
    on_block=print,
)

ws.run_forever()
```

Defintion

```
class beemapi.websocket.SteemWebsocket(urls, user='', password='', *args,
                                         only_block_id=False, on_block=None,
                                         keep_alive=25, num_retries=-1, **kwargs)
```

Create a websocket connection and request push notifications

Parameters

- **urls** (*str*) – Either a single Websocket URL, or a list of URLs
- **user** (*str*) – Username for Authentication
- **password** (*str*) – Password for Authentication
- **keep_alive** (*int*) – seconds between a ping to the backend (defaults to 25seconds)

After instanciating this class, you can add event slots for:

- `on_block`

which will be called accordingly with the notification message received from the Steem node:

```
ws = SteemWebsocket(
    "wss://gtg.steem.house:8090",
)
ws.on_block += print
ws.run_forever()
```

Notices:

- `on_block`:

```
'0062f19df70ecf3a478a84b4607d9ad8b3e3b607'
```

```
_SteemWebsocket__set_subscriptions()
__events__ = ['on_block']
__getattr__(name)
    Map all methods to RPC calls and pass through the arguments
__init__(urls, user='', password='', *args, only_block_id=False, on_block=None, keep_alive=25,
        num_retries=-1, **kwargs)
    Initialize self. See help(type(self)) for accurate signature.

__module__ = 'beemapi.websocket'
_ping()
_cancel_subscriptions()
_close()
    Closes the websocket connection and waits for the ping thread to close
_get_request_id()
_on_close(ws)
    Called when websocket connection is closed
_on_error(ws, error)
    Called on websocket errors
```

on_message (*ws, reply, *args*)

This method is called by the websocket connection on every message that is received. If we receive a notice, we hand over post-processing and signalling of events to `process_notice`.

on_open (*ws*)

This method will be called once the websocket connection is established. It will

- login,
- register to the database api, and
- subscribe to the objects defined if there is a callback/slot available for callbacks

process_block (*data*)

This method is called on notices that need processing. Here, we call the `on_block` slot.

reset_subscriptions (*accounts=[]*)**rpceexec** (*payload*)

Execute a call by sending the payload

Parameters `payload` (*json*) – Payload data

Raises

- **ValueError** – if the server does not respond in proper JSON format
- **RPCError** – if the server returns an error

run_forever ()

This method is used to run the websocket app continuously. It will execute callbacks as defined and try to stay connected with the provided APIs
